

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

brutes: is there to be no improvement in that direction? It has been proven that modifications are taking place in his dental armature, his dermal appendages (as the hair disappearing, and so forth), and perhaps to some extent in his very form, due to dress, as encasing the feet, and strapping certain parts of the body. Will these causes not, if continued, produce their ultimate effects?

However daintily he may mask the animals he kills and devours, he is still as carnivorous as most of the *Felidae*. He often settles his disputes by the murder of masses of his kind, and the leaders in such assaults are glorified by having monuments erected to them in the high places. In these days such monuments are seventy-five per cent more numerous than are those erected to the great among men of letters, of science, the arts, and the industries. All of this savors very strongly of savagery, and can hardly be characteristic of a fully developed race of men.

This aspect is not improved when we come to think of the vast number of what many in the world would reckon as our best developed specimens of men, whose minds are still controlled by the nursery myths, the miracles, and the fables that were told and sung to the children of the early peoples of the world in Asia. Is the mind of the man of the future to remain in such a condition of thralldom? In fact, the most of the opinions held, the institutions, the very language, the entire organization by and of the best existing types of men, are each and all to me highly indicative of a very early stage of the development of the species.

So I cannot fully coincide with Dr. Langdon when he says, "While, therefore, we may anticipate an increase in the average perfection of parts, and consequently a more harmonious development of man's present plan of structure, we cannot rationally look for any radical change in the plan itself." Although it would not demand any radical change in the *plan* of structure of present man, has it ever occurred to your correspondent that in the dim future of the world the *environment* of man may have progressively so changed as ultimately to produce a race of enormous giants; or, other conditions obtaining, a race of the veriest pygmies may be the result? Who among our present-day naturalists, had he lived in Eocene time, and become familiar with the little *Eohippus*, no bigger than a fox, would ever have predicted that from it was in time to be developed the highly modified modern horse? It is safe to say, not one, — yet *Eohippus* must have appeared quite perfect for its kind in its day.

There is every reason to believe that in the lapse of time, or when many more millions of years have rolled by, our little earth will become cold from changes now going on: she may solidify to her very core, and become as frigid as a moon, and utterly incapable of supporting any manner of life upon her surface. In fact, life will probably be at an end long before any such condition in her comes about. The last one of the human species, the very last individual of all, the very tip of the last twig of the tree of human descendants, must also die, — perish. If that modified form possesses sight, its eye may look out upon a remarkable scene indeed. Earth may be stripped of all timber; coal beds all burned up; metals all moulded into medallions, machines, and monuments; her land-surface graded nearly or quite level by causes now in operation; every other living thing, every lion, lark, and louse in the land exterminated; and nothing remaining but the works of the modified man. — R. W. SHUFELDT, M.D.

#### Rain-Making.

IN *Science* for Oct. 9 Mr. Powers takes exception to a short discussion of this question prepared by myself and published in August. I have no desire to enter the discussion, but simply to correct one or two misapprehensions of my own connection with this matter. Mr. Powers gives a novel view of Plutarch's statement regarding battles and rain. The following is a translation of Plutarch: "Extraordinary rains generally fall after great battles." He is doubtful whether by these the gods would wash out the trouble from the sky "or the blood and corruption, by the moist and heavy vapors they emit, thicken the air, which is liable to be altered by the smallest cause." It hardly seems as though this corresponds with the later view of Mr. Powers. But the view

of another rain-maker does not agree with that of Mr. Powers: "Let 10,000 Greeks march into battle chanting their 'paean' and shouting their 'allallas,' beating time meanwhile on their shields, while 100,000 Persians are advancing against them, continually shouting their terrible battle-cries; then let the great armies rush together with the tumult of clashing swords and shields, the hoarse death-cries and shouts of victory, and surely the sound-waves rising from such a din will literally shake the heavens, and are capable of producing no insignificant effect among the volatile currents of the upper air. Moreover, the heat generated from the struggling masses and the moisture evaporated from their perspiration would exercise a decided influence in disturbing the equilibrium of the atmospheric conditions."

Exception is taken to my very guarded statement, "During the war of the Rebellion there were over 2,200 battles, on an average *probably* as severe as the average of the 158 above mentioned" (by Mr. Powers). I have italicized a very important word. I had no time to do anything more that compare several of the running statements of the battles given in the old edition of "War and the Weather" with other facts. This I did sufficiently to satisfy myself that such a statement could be made. It is an open question in my mind just how one should treat a continued battle and firing in studying its probable effect upon the atmosphere. The more or less desultory firing in many battles could not be considered as of much importance. Moreover, any rain which fell after an interval of a few minutes must probably be regarded as in no wise due to the explosions. I do not say that the smoke and carbon from the powder might not have some influence, but whatever they had would be felt a hundred miles or more from the scene of the explosions.

Mr. Powers thinks that the currents of the atmosphere do not travel at the rate of twenty to fifty miles per hour, or, at least, during these battles they did not do so. This is a question of fact which has been proved by actual observation, and cannot be gainsaid. The only time these currents are not moving with this velocity is when a high area or "clearing condition" is passing. Mr. Powers's theory of storm formation is exceedingly unique, and possibly he could help meteorology by establishing that theory. What he would need to do would be to select a high area or a "clearing condition," and then make his explosions and note the result. It certainly is not a fact that two currents pass in opposite directions near the point of formation of our storms. Mr. Powers takes exception to my statement, "One thing seems very evident, that absolutely no rain can be obtained out of a dry atmosphere." I will now take out the word "seems" which has no business in this statement, and leave the rest without fear of contradiction by any one who reads the expression as I meant it.

#### BOOK-REVIEWS.

*Laboratory Practice.* By JOSIAH PARSONS COOKE, LL.D. New York, Appleton. 16°. \$1.

ALL students of chemistry are familiar with "The New Chemistry," by Professor Cooke, the first edition of which appeared eighteen years ago, when it was one of the earlier volumes of the International Scientific Series. That book, which has fascinated so many, now appears in a revised and enlarged form. The book now issued is described by the author as a "companion volume to 'The New Chemistry.'" As will be remembered, the earlier book was largely descriptive of the problems and theoretical discussions of modern chemistry. "Laboratory Practice" gives a series of experiments on the fundamental principles of chemistry. The purpose of the author is to furnish the beginner in chemistry with a text-book which shall aid him in doing his laboratory work, but only when this work is carried out under the guidance of a competent teacher, — a teacher who can speak to the students from the fulness of his own knowledge. Professor Cooke, as the head of the chemical department of Harvard College almost as long as there has been such a department — for more than forty years — has had great experience as a teacher of chemistry, and it is certain that each and all of those who have had the pleasure of tak-
